3 # Demo of "scitools pyreport", a modification of the original
4 # pyreport code to work with both matplotlib and scitools.easyviz.
5
6 # Comment lines starting with #! employ reStructuredText syntax,
7 # which has primitive math support but works well in HTML,
8 # while comment lines starting with #

```

Demonstrations

Run with `-l -e` options to turn on LaTeX support. `-t pdf` gives PDF output while `-t html` specifies HTML output. The name stem of the output file is specified by the `-o` option.

```

24 """
25 scitools pyreport -l -e -t pdf -o report_mpl -a '0.05 9' demo_pyreport.py
26 scitools pyreport -l -e -t html -o report_mpl -a '0.05 9' demo_pyreport.py
27 scitools pyreport -l -e -t pdf -o report_evz -a '0.05 9 easyviz' demo_pyreport.
   py
28 scitools pyreport -l -e -t html -o report_evz -a '0.05 9 easyviz' demo_pyreport.
   py
29 """

```

Solving the logistic equation

The (scaled) logistic equation reads

$$u'(t) = u(1 - u),$$

for $t \in (0, T]$ and with initial condition $u(0) = \alpha$.

```

35
36 # LaTeX version:

```

The (scaled) logistic equation reads

$$u'(t) = u(1 - u), \quad t \in (0, T]$$

with initial condition $u(0) = \alpha$.

```

44
45
46 def f(t, u):
47     return u*(1-u) # logistic equation
48
49
50 try:
51     alpha = float(sys.argv[1])
52 except IndexError:
53     alpha = 0.1 # default
54
55
56 try:
57     T = float(sys.argv[2])
58 except IndexError:
59     T = 8

```

We solve the logistic equation using the `dopri5` solver in `scipy.integrate.ode`. This is a Dormand-Prince adaptive Runge-Kutta method of order 4-5.

```

59
60 solver = ode(f)
61 solver.set_integrator('dopri5', atol=1E-6, rtol=1E-4)
62 solver.set_initial_value(alpha, 0)

```

The solution is computed at equally spaced time steps $t_i = i\Delta t$, with $\Delta t = 0.2$, $i = 1, 2, \dots$. The integration between t_i and t_{i+1} applies smaller, adaptive time steps, adjusted to meet the prescribed tolerances of the solution.

```
68
69 # LaTeX version:
```

The solution is computed at equally spaced time steps $t_i = i\Delta t$, with $\Delta t = 0.2$, $i = 1, 2, 3, \dots$. The integration between t_i and t_{i+1} applies smaller, adaptive time steps, adjusted to meet the prescribed tolerances of the solution.

```
77
78 dt = 0.2          # time step
79
80 u = []; t = []    # store solution and times
81
82 while solver.successful() and solver.t < T:
83     solver.integrate(solver.t + dt)
84     # current time is in solver.t, current solution in solver.y
85     u.append(solver.y); t.append(solver.t)
86
87 plot = 'matplotlib'
88 try:
89     if sys.argv[3] == 'easyviz':
90         plot = 'easyviz'
91 except IndexError:
92     pass
93 if plot == 'matplotlib':
94     import matplotlib.pyplot as plt
95 else:
96     import scitools.std as plt
97
98 plt.plot(t, u)
99 plt.xlabel('t')
